THE GREEN COSTS OF KELO: ECONOMIC DEVELOPMENT TAKINGS AND ENVIRONMENTAL PROTECTION

ILIYASOMIN*  
JONATHAN H. ADLER**

INTRODUCTION

The Supreme Court’s recent decision in Kelo v. City of New London has rekindled the debate over “economic development” takings—condemnations that transfer property from one private owner to another solely on the ground that doing so might improve the local economy or increase tax revenue. While such takings have been condemned by many commentators on both the right and the left, environmentalists have been notably absent among Kelo’s critics. Some environmentalists have even defended the Kelo decision and the use of eminent domain to spur private economic development. At the same time, scholarly commentary on Kelo and other economic development takings decisions has largely ignored their potential environmental effects.

This Article provides the first detailed analysis of the environmental effects of Kelo and economic development takings generally. It contends that environmentalist support for economic development takings is misguided, and that the rule embodied by the Supreme Court’s Kelo decision is bad for property owners and environmental protection alike. There is a strong environmental rationale for strictly limiting or prohibiting the use of eminent domain for economic development.3
Kelo's holding that economic development takings are a legitimate public use under the Fifth Amendment's Takings Clause came shortly after County of Wayne v. Hathcock, in which the Michigan Supreme Court overruled Poletown Neighborhood Council v. City of Detroit, which, at the time, was the most famous earlier decision justifying economic development takings. While it was not the first decision upholding economic development condemnations, Poletown was by far the most widely publicized and notorious. Public attention primarily focused on the massive scale of Detroit's use of eminent domain; under the guise of economic development takings, Detroit destroyed an entire neighborhood by condemning numerous businesses, churches, schools, and the homes of some 4200 people. After condemnation, the land was transferred to General Motors for the construction of a new factory.

5. 684 N.W.2d 765 (Mich. 2004) (holding that economic development takings are unconstitutional).

jurisprudence. It is not surprising that Kelo was denounced and Hathcock cheered by many conservative and libertarian supporters of property rights. Indeed, the Kelo property owners were represented by lawyers affiliated with the Institute for Justice, a prominent libertarian public interest group. Observers unfamiliar with the history of economic development takings might be more surprised to learn that an amicus brief supporting the property owners in Kelo was filed jointly by the NAACP, the AARP, and the Southern Christian Leadership Conference. In Hathcock, pro-property owner amicus briefs included filings by the Michigan branch of the American Civil Liberties Union, and left-wing activist and third-party presidential candidate Ralph Nader. Nader had also been a prominent opponent of the original Poletown condemnations in 1981.
in *Kelo* on behalf of Jane Jacobs, a prominent urban development theorist normally associated with the political left.16

Many left-of-center scholars and activists oppose economic development takings because of their tendency to inflict disproportionate harm on the poor and on ethnic minorities, often for the benefit of corporate development interests.17 After the *Kelo* decision was announced, it was denounced by numerous liberal political leaders including former President Bill Clinton,18 Democratic National Committee Chair Howard Dean, who blamed the result on a “Republican-appointed Supreme Court;”19 and California Representative Maxine Waters, a prominent liberal African-American politician.20

Environmentalists have been notably absent among *Kelo*’s critics. The American Farmland Trust was one of the few conservation organizations to express concern in the immediate wake of the decision.21 Most other environmental groups stayed on the sidelines.22 Moreover, some prominent environmental lawyers actively supported the City of New London’s arguments against judicial limitations on the use of eminent domain. John D. Echeverria, executive director of the Georgetown Environmental Law & Policy Institute, collaborated on an amicus brief for the American Planning Association defending the use of eminent domain for economic development.23 The Community Rights Counsel, a public interest law firm focusing on environmental issues, filed an amicus brief in support of New London on behalf of various local government

20. See Charles Hurt, *Congress Assails Domain Ruling,* WASH. TIMES, July 1, 2005, at A1 (quoting Waters denouncing *Kelo* as “the most un-American thing that can be done”).
22. Among those environmental groups that frequently participate in environmental litigation that neither participated in nor urged a given outcome in the *Kelo* case were the Natural Resources Defense Council, Earthjustice, Environmental Defense, and Friends of the Earth.
associations. After the decision, Environmental Law Institute President Leslie Carothers wrote that limiting state and local governments’ use of eminent domain for economic development would have been a “serious setback” from “an environmental perspective.” Environmentalists have been suspicious of judicial protection of property rights under the Takings Clause because of the fear that it might impede environmental regulation and restrict the use of eminent domain to create public parks and other environmental amenities. Whatever the merits of this view with respect to other takings issues, we contend that it has virtually no relevance to judicial bans on “economic development” takings. More importantly, allowing such condemnations could actually harm the environment in several ways. Conservationists and other environmental advocates, we suggest, should support barring the use of eminent domain for economic development.

Part I of this Article briefly explains the rationales of the Kelo and Hathcock decisions and shows why a Hathcock-like ban on economic development takings is highly unlikely to impede environmental regulation or threaten the use of eminent domain for legitimate conservation purposes. The doctrinal rules advocated by the Hathcock

28. See infra Part I.
Court and the *Kelo* dissenters, and adopted by courts in the eleven states that ban economic development takings, leave ample room for the use of eminent domain to advance environmental goals. This doctrinal point is buttressed by empirical evidence indicating that none of the eleven states with *Hathcock*-like bans on economic development takings have ever used this rule to block condemnation of property for environmental or conservation purposes.

Part II shows that economic development takings may cause environmental harm. Allowing the use of eminent domain for economic development poses a particular danger to private conservation lands, agricultural lands, and open space. Because land owned by conservation nonprofits produces few economic benefits and does not contribute to tax revenue, it is likely to be targeted by developers and local governments that use eminent domain to advance their development interests. Economic development takings can also harm the environment by promoting environmentally harmful development, undermining property rights, and furthering dubious development plans that sap community wealth and reduce resources available for environmental protection. In many situations, economic development takings end up giving us the worst of both worlds: they cause environmental harm and reduce economic growth by transferring land to inefficient development projects.

I. WHY BANNING ECONOMIC DEVELOPMENT TAKINGS DOES NOT IMPEDE ENVIRONMENTAL PROTECTION

A ban on economic development takings does not threaten government efforts to protect environmental values. This is readily demonstrated on the basis of both doctrinal analysis and empirical evidence from the eleven states whose supreme courts have forbidden the economic development rationale. None of these states have had successful challenges to

34. *See infra* Part II.B.
35. The eleven states are Arkansas, Florida, Illinois, Kentucky, Maine, Michigan, Montana, Ohio, Oklahoma, South Carolina, and Washington. See *City of Little Rock v. Raines*, 411 S.W.2d 486, 494–95 (Ark. 1967) (private economic development project not a public use); *Baycol, Inc. v. Downtown Dev. Auth.*, 315 So.2d 451, 457 (Fla. 1975) (holding that a "public [economic] benefit" is not synonymous with "public purpose" as a predicate which can justify eminent domain); *Sw. Ill. Dev. Auth. v. Nat’l City Envtl., L.L.C.*, 768 N.E.2d 1, 9–11 (Ill. 2002) (holding that a "contribution to positive economic growth in the region" is not a public use justifying condemnation), *cert. denied*. 
environmental regulations arise from their rulings on economic development takings. At the same time, public officials in these states retain the power to use eminent domain for conservation purposes.

A. The Rationales of Kelo and Hathcock

The Kelo decision upheld economic development takings in a case that arose from the condemnation of ten residences and five other properties as part of a 2000 development plan in New London, Connecticut, which sought to transfer the property to private developers. None of the properties in question were alleged to be "blighted or otherwise in poor condition." The condemnations were initiated under a plan prepared by the New London Development Corporation (NLDC), a private, nonprofit entity established "to assist the city council in economic development planning." The city claimed the project would "provide appreciable benefits to the community, including, but not limited to, new jobs and 537 U.S. 880 (2002); City of Owensboro v. McCormick, 581 S.W.2d 3, 8 (Ky. 1979) ("No 'public use' is involved where the land of A is condemned merely to enable B to build a factory . . . .") (citation omitted); Opinion of the Justices, 131 A.2d 904, 905–06 (Me. 1957) (holding that private "industrial development" to enhance economy not a public use); County of Wayne v. Hathcock, 684 N.W.2d 765 (Mich. 2004) (overruling Poletown and holding that economic development takings are unconstitutional); City of Bozeman v. Vaniman, 898 P.2d 1208, 1214–15 (Mont. 1995) (holding that a condemnation that transfers property to a "private business" is unconstitutional unless the transfer to the business is "insignificant" and "incidental" to a public project); City of Norwood v. Horney, 853 N.E.2d 1115, 1140–41 (Ohio 2006) (following County of Wayne v. Hathcock in holding that "economic development" alone does not justify condemnation); Bd. of County Comm’rs of Muskogee County v. Lowery, 136 P.3d 639, 642 (Okla. 2006) (holding that "economic development" is not a "public purpose" under the Oklahoma Constitution); Ga. Dep’t of Transp. v. Jasper County, 586 S.E.2d 853, 856 (S.C. 2003) (holding that even a substantial "projected economic benefit" cannot justify condemnation); Karesh v. City of Charleston, 247 S.E.2d 342, 345 (S.C. 1978) (striking down taking justified only by economic development because such condemnations do not ensure "that the public has an enforceable right to a definite and fixed use of the property") (quoting 29 C.J.S. Eminent Domain § 31)); In re City of Seattle, 638 P.2d 549, 556–57 (Wash. 1981) (disallowing plan to use eminent domain to build retail shopping where purpose was not elimination of blight); Hogue v. Port of Seattle, 341 P.2d 171, 187 (Wash. 1959) (denying condemnation of residential property where government sought to "devote it to what it considers a higher and better economic use"). In some of these states, the wording of the state constitution restricts private-to-private condemnations much more explicitly than does the Federal Takings Clause. See, e.g., Muskogee, 136 P.3d at 639, 651–52 (discussing differences between the wording of the Oklahoma Constitution and that of the Fifth Amendment and using the distinction as justification for interpreting the state takings clause in a way contrary to the U.S. Supreme Court’s interpretation of the Federal Takings Clause in Kelo).
increased tax revenue." Landowners challenged the condemnations on the ground that such transfers from one private party to another were not for a "public use" as required by the Fifth Amendment’s Takings Clause. The constitutionality of the takings was upheld by the Supreme Court of Connecticut in a 4-3 decision. The U.S. Supreme Court affirmed in an unexpectedly close 5-4 decision.

The majority opinion by Justice Stevens focused on the alleged need to maintain the Court’s “policy of deference to legislative judgment” on public use issues. It refused to accept the property owners’ argument that the transfer of their property to private developers, rather than to a public body, required a heightened degree of judicial scrutiny. The Court also refused to require the city to provide any evidence that the takings were likely to achieve the claimed economic benefits which justified them in the first place. On all these matters, the Kelo majority chose not to “second-guess the City’s considered judgments about the efficacy of the development plan.”

The Kelo Court would uphold almost any economic development takings that arises from “an integrated development plan.” This approach, while slightly less deferential than earlier Supreme Court public use decisions, still provides little protection for property owners. Virtually any condemnation can be legitimized by a plan of some kind—especially if the Court continues to refuse to “second-guess” the plan’s rationale and efficacy.

The Michigan Supreme Court’s decision in County of Wayne v. Hathcock addressed the same issue as Kelo, but under the Michigan Constitution’s takings clause rather than the federal one. Overruling
Poletown, Hathcock forbade economic development takings. Hathcock and other decisions striking down the economic development rationale fall short, however, of a complete ban on private-to-private condemnations. In Hathcock, for example, the Michigan Supreme Court laid out three scenarios in which private-to-private takings will still be upheld:

1. where "public necessity of the extreme sort" requires collective action;

2. where the property remains subject to public oversight after transfer to a private entity; and

3. where the property is selected because of "facts of independent public significance" rather than the interests of the private entity to which the property is eventually transferred.

These three categories, especially the latter two, have been replicated in other states that forbid economic development takings. Even more importantly, neither Hathcock nor other decisions limiting the use of eminent domain for economic development forbid condemnations where the property is to be transferred to government ownership or to a private owner—such as a public utility or common carrier—that is legally required to allow the public to access or use the property. As a result, public officials in these states retain ample means of advancing conservation objectives, including the use of eminent domain. Prohibiting the use of eminent domain for economic development does not foreclose its use for other purposes, including environmental protection.

and U.S. CONST. amend. V ([N]or shall private property be taken for public use, without just compensation.").

55. Hathcock, 684 N.W.2d at 783 (quoting Poletown Neighborhood Council v. City of Detroit, 304 N.W.2d 455, 478–80 (Ryan, J., dissenting)). The Hathcock court itself did not originate the three exceptions but consciously borrowed them from Justice Ryan's Poletown dissent. See Hathcock, 684 N.W.2d at 780–83 (relying extensively on Poletown, 304 N.W.2d at 478–80 (Ryan, J., dissenting)).

56. See Somin, Controlling, supra note 3, at 85–88 (noting parallels in other states).

57. See, e.g., Hathcock, 684 N.W.2d at 782 (noting that private-to-private takings are allowed if the property "will be devoted to the use of the public, independent of the will of the corporation taking it") (citations omitted).
B. Doctrinal Analysis

Straightforward doctrinal analysis readily shows why bans on economic development takings do not forbid condemnation proceedings or regulation undertaken for purposes of environmental protection and conservation. In other words, very few if any legitimate environmental uses of eminent domain are threatened by the Hathcock rule.

1. Government Ownership

Perhaps the most important reason why a rejection of Kelo would not imperil environmental protection is that a ban on economic development takings would not forbid condemnations that transfer property to government ownership. This point is universally acknowledged by state courts that ban economic development takings and also by the U.S. Supreme Court dissenters in Kelo. As Justice O'Connor notes in the lead dissent, the state’s power to condemn “private property” in order to transfer it to “public ownership” is “relatively straightforward and uncontroversial.”

This long-established power encompasses the vast bulk of environmentally-related condemnations. If the government condemns land in order to establish a state or national park, create a wildlife refuge, preserve open space, or acquire valuable natural resources, such a condemnation could not be invalidated provided that the land was transferred to public ownership. Similarly, should a local government condemn a right-of-way for the construction of a government-owned mass transit line, public ownership of the right-of-way would authorize the use of eminent domain for such purposes. This fact should allay the most prominent environmental concerns about potential limits on eminent domain.

The same point applies to most, if not all, environmental regulatory takings. Even if one assumes that environmental regulations restricting development or potentially harmful land uses are tantamount to the seizure of private property, barring the use of eminent domain for economic development would not limit the state’s regulatory power. So long as the rights condemned by the regulation are not transferred to other private
parties, they are retained by the government—even if held in the public trust and not actually used—and therefore cannot be considered private-to-private takings. As with any other use of eminent domain, the government would have to compensate the landowner for the taking of the land, but this requirement is separate from the question of whether a given regulatory action constitutes a taking for “public use.” For example, if the government restricts the development of private land in order to prevent environmental degradation, the aggrieved landowner may seek compensation for the “taking,” but the action could not be challenged as a violation of state or federal public use clauses so long as the government did not transfer the development rights in question to another private owner. Some would contend that such regulations should not be considered takings at all, but that issue is separate from the question of whether the regulations, assuming that they are takings, can be invalidated for lack of a “public use.” Under the reasoning of Hathcock and the Kelo dissenter, they could not be.

2. Private Ownership with Legally Mandated Public Access

Bans on economic development takings still permit condemnations for transfer to government ownership and those that “transfer private property to private parties, often common carriers, who make the property available for the public’s use—such as with a railroad, a public utility, or a stadium.” Even Justice Thomas’s dissent in Kelo, which takes the most restrictive view of public use of any of the nine Supreme Court justices, acknowledges that private-to-private condemnations are constitutional if “the public has a legal right to use . . . the property.”

In the environmental context, this means that the government could use private-to-private condemnations to promote environmental goals so long as the new private owners are required to give the general public a legal right of access. For example, the government could condemn property for transfer to a privately owned park or nature preserve so long as the new owners are legally required to provide access to the public. The same reasoning would protect the use of eminent domain to facilitate the construction of privately run rail lines or other forms of environmentally

63. Kelo, 545 U.S. at 498 (O’Connor, J., dissenting); id. at 508 (Thomas, J., dissenting) (noting that private-to-private condemnations are acceptable if “the public has a legal right to use[ ] the property.”); see also County of Wayne v. Hathcock, 684 N.W.2d 765, 782 (Mich. 2004) (same).
64. Kelo, 545 U.S. at 508 (Thomas, J., dissenting).
desirable transit infrastructure. Such access would not have to be free of charge or restrictive conditions. As in the case of public utilities and common carriers, the owners of privately owned environmental amenities would merely have to guarantee access to all members of the public willing to pay a set fee and obey relevant rules.

3. The Hathcock Exceptions

The Hathcock decision outlined three additional exceptions to its ban on private-to-private takings: cases of "extreme public necessity," situations where the condemned property remained subject to "public control," and, most importantly, instances where the condemnation was justified by facts of "independent public significance." In this last scenario, which includes cases of blight, "the act of condemnation itself, rather than the use to which the condemned land eventually would be put, ... [is the] public use" justifying condemnation. For that reason, the danger of abuse on behalf of private interest groups is reduced, because it allegedly does not matter what the new owners of the property do with it so long as the old, harmful uses of the condemned land are mitigated or eliminated. On this basis, it is likely that governments could condemn land to eliminate environmental harms.

The paradigmatic example of this type of scenario is the removal of "urban blight for the sake of public health and safety." Forty-six of the fifty states, including ten of the eleven that forbid economic development takings, have statutes that permit condemnation of blighted property for redevelopment purposes. The Hathcock justification of blight

65. Indeed, the Kelo dissenters acknowledged the legitimacy of using eminent domain to facilitate the operations of "common carriers" including railroads. See Kelo, 545 U.S. at 498 (O'Connor, J., dissenting).
66. Hathcock, 684 N.W.2d at 783.
67. Id.
68. It is worth emphasizing that state and local governments retain many other means of addressing harmful land uses and blight beyond the exercise of eminent domain, including land-use regulations and public nuisance actions.
70. See cases cited in supra note 35.
71. Hudson Hayes Luce, The Meaning of Blight: A Survey of Statutory and Case Law, 35 REAL PROP. PROB. & TR. J. 389, 391 (2000); Somin, Limits of Backlash, supra note 3, at 30. The four exceptions are Utah, Florida, Nevada, and North Dakota, all of which recently forbade both blight and economic development condemnations by statute. See Utah Code Ann. § 1713-4-202 (Supp. 2005) (outlining powers of redevelopment agencies and omitting the power to use eminent domain for blight alleviation or development); Fla. Stat. § 73.014(2) (enacted 2006) (requiring that condemning authorities "may not exercise the power of eminent domain to take private property for the purpose of
condemnations was also endorsed by Justice O'Connor in the principal \emph{Kelo} dissent.\footnote{See \emph{Kelo} v. City of New London, 545 U.S. 469, 500 (2005) (O'Connor, J., dissenting) (endorsing the Supreme Court's decision to allow blight condemnations in \emph{Berman} v. Parker, 348 U.S. 26 (1954)).} As O'Connor explains, with blight condemnations, "a public purpose [is] realized when the harmful [blight is] eliminated. Because each taking \emph{directly} achieve[s] a public benefit, it [does] not matter that the property was turned over to private use."\footnote{Id.} Justice Thomas's solo dissent in \emph{Kelo} is the only noteworthy modern judicial opinion that even comes close to advocating judicial invalidation of blight condemnations.\footnote{See \emph{id.} at 519–21 (Thomas, J., dissenting) (suggesting that \emph{Berman} should perhaps be overruled).}

Condemnations that are intended to eliminate sources of pollution or to alleviate other kinds of environmental damage could easily be justified on exactly the same reasoning as blight condemnations; the sole difference between the two is that the latter seek to eliminate dangerous or dilapidated structures, while the former target environmental risks. In both situations "the act of condemnation \emph{itself}, rather than the use to which the condemned land eventually would be put, [is the] public use" justifying condemnation.\footnote{County of Wayne v. Hathcock, 684 N.W.2d 765, 783 (Mich. 2004).} Indeed, some of the harms used to justify blight condemnations are in fact environmental in nature, including the "spread [of] disease"\footnote{\emph{Berman} v. Parker, 348 U.S. 26, 32 (1954).} and "health hazards" such as "hazardous waste sites, trash, vermin, or fire hazards."\footnote{\emph{Luce}, supra note 71, at 395 (noting that fifty-two of fifty-four U.S. jurisdictions include such "health hazards" as part of the definition of blight).} Similar rationales could be used to condemn abandoned industrial properties or urban brownfields in order to facilitate their containment or cleanup.\footnote{See \emph{Hope Whitney}, \emph{Cities and Superfund: Encouraging Brownfield Redevelopment}, 30 ECOLOGY L.Q. 59, 69–70 (2003) (discussing use of eminent domain in brownfield redevelopment).}

Blight condemnations are hardly unproblematic. Historically, they have often been used to displace poor or minority populations for the benefit of white middle- or upper-class interests.\footnote{See Wendell E. Pritchett, \emph{The "Public Menace" of Blight: Urban Renewal and the Private Uses of Eminent Domain}, 21 YALE L. & POL'Y REV. 1 (2003) (providing extensive discussion of the history of blight condemnations and the harms they cause); \emph{Somin}, \emph{Controlling}, supra note 3, at 91–94} Since World War II, up to four
million people have been dispossessed in this way. Postwar urban renewal condemnations were so notorious for targeting African-Americans that "[i]n cities across the country, urban renewal came to be known as 'Negro removal.'"

Furthermore, some states define blight so broadly that almost any property becomes vulnerable to condemnation as a result. Recent court decisions have upheld blight condemnations in such affluent areas as New York City’s Times Square and downtown Las Vegas. Even some defenders of eminent domain acknowledge that blight designations are subject to occasional abuse. For present purposes, however, the point at issue is not the possibility that the blight exception is too broad and has the potential for abuse, but the potential danger that it is too narrow to allow for condemnations intended to eliminate environmental harms. Under present case law, any such concern is severely misplaced.

The implications of Hathcock’s other two exceptions for environmental takings are more difficult to determine because their scope remains unclear as of this writing. The exception for “public necessity of the extreme sort” could potentially be used to justify private-to-private condemnations that eliminate major environmental threats, especially if there is no other way to address them. Similarly, the “public control” exception could be used to defend private-to-private environmental condemnations “where the property remains subject to public oversight,” as might occur where eminent domain is used to condemn conservation easements or rights-of-way across private land. However, the scope of this exemption is difficult to predict because the Hathcock court failed to

(same); Somin, Overcoming Poletown, supra note 7, at 1035–38 (citing sources and evidence).

80. Somin, Overcoming Poletown, supra note 7, at 1037.

81. Pritchett supra note 79, at 47.

84. See Somin, Overcoming Poletown, supra note 7, at 1028–33 (noting ambiguity and discussing possible conflicting interpretations).

86. The Hathcock court suggests that this exception may only apply if the public project in question "requires collective action" through eminent domain in order to acquire the land necessary to carry it out. Hathcock, 684 N.W.2d at 783. In many, if not most, instances, local governments will have alternatives to the use of eminent domain to address blight and other nuisance-causing land conditions.

87. Hathcock, 684 N.W.2d at 783.
explain how much "public control" is enough to justify an otherwise invalid taking. 88

Even if the first and second Hathcock exceptions turn out to provide little or no protection to environmental takings, this result would have very limited significance. Virtually any environmental taking or regulation could be justified by rules permitting takings for government ownership, for private entities that allow the public a legal right of access, and those intended to alleviate blight and analogous harms.

Some environmentalists and advocates of economic development takings contend that eminent domain can be used to advance environmental protection by encouraging infill and the redevelopment of older urban areas as an alternative to urban sprawl. 89 In some instances, eminent domain may be the easiest way to assemble the large, contiguous land parcels necessary to make dense urban redevelopment economically viable. In addition, some fear that limiting or prohibiting economic development takings would prevent the use of eminent domain for environmentally beneficial projects.

It is certainly possible that restricting the use of eminent domain for economic development could impede some environmentally desirable projects. In our view, however, such concerns are greatly overstated, if not completely unwarranted. First, many urban redevelopment projects could still proceed under one or more of the Hathcock exceptions. Much urban development is planned for areas that could qualify for a blight designation. In other instances, eminent domain might be permitted insofar as it addresses a public necessity of the extreme sort, beyond the potential economic value of the development itself. 90

Where a project does not qualify under these exceptions, there is good reason to question the need for eminent domain at all. While eminent domain can be used to overcome holdout problems in the assembly of large land parcels, there are numerous private sector tools to overcome 88. Hathcock, 684 N.W.2d at 783–83; see also Somin, Overcoming Poletown, supra note 7, at 1031 (discussing this ambiguity).
89. See, e.g., Harold Brodsky, Land Development and the Expanding City, 63 ANNALS ASS’N AM. GEOGRAPHERS 159, 163–66 (1973) (arguing that the power of eminent domain should be used to promote urban development, thereby preventing sprawl); Carothers, supra note 25; Echeverria & Lurman, supra note 26; Thomas W. Merrill, The Misplaced Flight to Substance, 19 PROB. & PROP. 16, 19–20 (2005) (arguing that economic development takings might be used to prevent "sprawl"); cf. Herman G. Berkman, Decentralization and Blighted Vacant Land, 32 LAND ECON. 270, 279–80 (1956) (arguing that the government should make more urban land available for development in order to prevent harmful sprawl); Charles Siemon, Who Bears the Cost? LAW & CONTEMP. PROBS., Winter 1987, at 115, 125–26 (same).
90. Hathcock, 684 N.W.2d at 783.
such problems without the use of eminent domain.\textsuperscript{91} Where these are ineffective, it is highly likely that the reason for failure is the fact that the current uses of the property in question are more valuable to society than those planned by the developers who seek to acquire it.\textsuperscript{92}

It is also important to separate the theoretical environmental benefits of the widespread use of eminent domain from the practical reality of how eminent domain is used by government agencies. Where government officials are authorized to condemn property for economic development, they become subject to substantial interest group pressures to approve projects that benefit parochial private interests, such as commercial developers, at the expense of the general public.\textsuperscript{93} While it is theoretically possible that urban redevelopment projects would be undertaken with environmental values in mind, this does not appear to be the actual practice where private property is taken for economic development purposes.\textsuperscript{94} For this reason, there are very few, if any, instances where economic development takings have significantly advanced environmental protection.\textsuperscript{95} Even insofar as such examples exist, the environmental benefits of such projects must be weighed against the significant environmental risks posed by permitting economic development takings generally.\textsuperscript{96} Moreover, in the rare cases where an economic development condemnation might create environmental benefits, it is likely that it could be justified under one of the rationales described above. Consequently, environmental benefits could be created without legitimizing the economic development rationale in the vast number of cases where condemnations either do not advance environmental values or actually cause environmental harms.

\textsuperscript{91} See, e.g., Daniel B. Kelly, The "Public Use" Requirement in Eminent Domain Law: A Rationale Based on Secret Purchases and Private Influences, 92 Cornell L. Rev. 1, 18–30 (2006). (discussing effective private sector alternatives to eminent domain); Somin, Controlling, supra note 3, at 21–29 (same).

\textsuperscript{92} See Kelly, supra note 91; Somin, Controlling, supra note 3, at 24–27.

\textsuperscript{93} For a detailed discussion, see Somin, Controlling, supra note 3, at 8–23.

\textsuperscript{94} Even proponents of the use of eminent domain for economic development rarely highlight the land conservation or environmental benefits of eminent domain projects. See, e.g., INT'L ECON. DEV. COUNCIL, supra note 83.

\textsuperscript{95} See id. at 29 (tangentially noting alleged environmental benefits of one of seven projects selected for case studies of the successful use of eminent domain).

\textsuperscript{96} See infra Part II.
C. Empirical Evidence from States that Have Banned Economic Development Takings

The conclusion drawn from the above doctrinal analysis is bolstered by empirical evidence from the eleven states whose supreme courts have banned economic development takings. Despite the lack of doctrinal support for the notion, a ban on economic development takings could theoretically lead to restrictions on environmental takings through some sort of slippery slope process. In practice, any such possibility remains purely theoretical.

State supreme courts that ban economic development takings include Arkansas, Florida, Illinois, Kentucky, Maine, Michigan, Montana, Ohio, Oklahoma, South Carolina, and Washington. Two other state supreme courts, those of New Hampshire and Massachusetts, significantly restrict them without imposing a categorical ban. While some of these decisions, including the 2004 Hathcock case, are recent, others are of longstanding vintage. For example, Maine rejected the economic development rationale in 1957, Washington in 1959, Arkansas in 1967, Florida in 1975, South Carolina in 1978, and Kentucky in 1979. More than enough time has

97. See generally Eugene Volokh, Mechanisms of the Slippery Slope, 116 HARV. L. REV. 1026 (2003). One possible slippery slope mechanism that could lead to restrictions on environmental takings might be an argument that some environmental condemnations only benefit specific private individuals rather than the general public. For example, neighboring property owners may benefit disproportionately from the condemnation of a conservation easement across another landowner’s property.

98. See infra notes 100–01 and cases cited therein.

99. See Opinion of the Justices, 250 N.E.2d 547, 561 (Mass. 1969) (holding that economic benefits of a proposed stadium were not enough of a public use to justify condemnation); Merrill v. City of Manchester, 499 A.2d 216, 217–18 (N.H. 1985) (holding that condemnation for industrial park was not a public use where no harmful condition was being eliminated).

100. For example, Oklahoma only forbade economic development takings in 2006, Illinois in 2002, and Montana in 1995. See Sw. Ill. Dev. Auth. v. Nat’l City Envtl., 768 N.E.2d 1, 9–11 (Ill. 2002) (holding that a “contribution to economic growth in the region” is not a public use justifying condemnation); City of Bozeman v. Vaniman, 898 P.2d 1208, 1214 (Mont. 1995) (holding that a condemnation that transfers property to a “private business” is unconstitutional unless the transfer to the business is “insignificant” and “incidental” to a public project); Bd. of County Comm’rs of Muskogee County v. Lowery, 136 P.3d 639, 647–52 (Okla. 2006) (holding that “economic development” is not a “public purpose” under the Oklahoma state constitution).

101. See City of Little Rock v. Raines, 411 S.W.2d 486, 494–95 (Ark. 1967) (holding that a private economic development project was not a public use); Baycol, Inc. v. Downtown Dev. Auth., 315 So.2d 451, 457 (Fla. 1975) (holding that “‘public [economic] benefit’ is not synonymous with ‘public purpose’ as a predicate which can justify eminent domain”); City of Owensboro v. McCormick, 581 S.W.2d 3, 8 (Ky. 1979) (“No ‘public use’ is involved where the land of A is condemned merely to enable B to build a factory.”); Opinion of the Justices, 131 A.2d 904, 905–06 (Me. 1957) (holding that “industrial development” is not a public use); Karesh v. City of Charleston, 247 S.E.2d 342, 345 (S.C. 1978) (striking down taking justified only by economic development);
passed to give courts in these states an opportunity to use the ban on economic development takings to restrict environmental condemnations or regulations, should they be so inclined. Strikingly, there is not even one published opinion in any of these states that has actually done so. The same holds true for Massachusetts and New Hampshire, the two states whose high courts place major restrictions on economic development takings without completely banning them.

Only one published decision comes close to striking down an environmental taking on public use grounds in any of the states that ban or restrict the economic development rationale. In 1974, the Maine Supreme Court invalidated a taking intended to promote the scenic beauty of areas adjacent to state highways. Yet the court acknowledged that "the restoration, preservation and enhancement of scenic beauty adjacent to public highways is a public use," and only invalidated the taking at issue because the condemnation in question was "unreasonable and an abuse of power" under the terms of the Maine statute in question, as interpreted in light of state constitutional requirements. Whatever the merits of this decision, it had no connection to the state's ban on economic development takings. By contrast, at least one decision from the relevant states explicitly upheld private-to-private environmental takings against a public use challenge, even after the state supreme court had banned economic development takings. Other decisions from these states have also noted that environmental protection is a recognized public use.

It is noteworthy that the states analyzed here are ideologically and economically diverse. They include conservative states such as Kentucky and South Carolina, liberal states such as Washington and Michigan, and

---

Hogue v. Port of Seattle, 341 P.2d 171, 187 (Wash. 1959) (denying condemnation of residential property when justification for condemnation was the government's desire to "devote it to what it considers a higher and better economic use").

102. There are also no unpublished opinions reaching such a conclusion in the Westlaw and Lexis databases for any of the eleven states. However, we cannot completely rule out the possibility that there are unpublished opinions that have not been recorded in an electronic database. Obviously, the precedential impact of any such opinions is likely to be extremely small at best.

103. Finks v. Me. State Highway Comm'n, 328 A.2d 191, 800 (Me. 1974).

104. Id. at 794 (quoting Wes Outdoor Adver. Co. v. Goldberg, 262 A.2d 199, 202 (N.J. 1970)).

105. Id. at 799-800.

106. See Hallauer v. Spectrum Props., Inc., 18 P.3d 540, 541 (Wash. 2001) (upholding private-to-private condemnation intended to divert water for purposes of "domestic use, and to ponds for fish propagation").

more centrist states such as Florida and Illinois. Further, they include both agricultural states, such as Montana and Kentucky, and more industrialized ones such as Michigan and Illinois. However, none of these states’ courts have reached the sorts of results that environmentalists might fear. While we cannot prove with absolute certainty that there would be no restrictions on environmental regulation or various conservation measures if a ban on economic development takings were adopted by other states or by the United States Supreme Court, the available evidence suggests that any such restrictions are highly unlikely.

II. HOW ECONOMIC DEVELOPMENT TAKINGS THREATEN ENVIRONMENTAL HARM

Prohibitions on the use of eminent domain for economic development do not hamper environmental protection efforts. Allowing such use of eminent domain, on the other hand, poses significant environmental risks, particularly to private land conservation. If state and local governments are allowed to use eminent domain to promote development, facilitate private industry, and expand the local tax base, it is likely that some condemnations will target conservation land and open space, including property owned by land trusts or otherwise protected with conservation easements. Insofar as eminent domain is used to subsidize industrial or commercial development, it further threatens environmental harm, particularly where such development displaces land uses that have less intense environmental impacts. Encouraging inefficient land uses and excessive development has the potential to increase the environmental impacts of economic activity.

Limiting the use of eminent domain for economic development will not end all environmentally harmful uses of eminent domain. Such a rule would still allow governments to condemn conservation lands for publicly owned projects, and would not prevent the use of overbroad blight designations to condemn undeveloped land. Eminent domain would also

108. See infra Part II.A.
109. For example, in December 2005, officials in Willacy County, Texas, announced plans to condemn a 1500-acre nature preserve on South Padre Island owned by The Nature Conservancy to construct a ferry landing. See James Pinkerton, Nature Area’s Future Shaky, HOUSTON CHRON., Dec. 18, 2005; see also Carter Smith, South Padre Island Preserve Deserves Our Protection, HOUSTON CHRON., Dec. 27, 2005. The proposed use of the land, a public ferry landing designed to increase public access to the beaches on South Padre Island, would likely remain permissible if economic development takings were prohibited.
110. See, e.g., Jim Herron Zamora, Lockyer Challenges Seizure of Land for Private Project, S.F. CHRON., July 27, 2005, at B8; see also Somin, Controlling, supra note 3, at 89–91 (discussing
remain available for the construction of roads and infrastructure that facilitate the development of previously undeveloped lands. Nonetheless, the proposed rule can still do much to limit the environmental costs of eminent domain, even if it cannot completely eliminate them.

A. The Threat to Private Land Conservation

Private conservation efforts in the United States date back over one hundred years. Environmental organizations, such as the National Audubon Society, trace their roots to early efforts to protect species habitat and other resources through the use of private property rights. Today, private conservation plays an ever-increasing and indispensable role in environmental protection. "Leaving rural land protection in the hands of counties and states would consign most of the wildlife habitat in the nation to oblivion," warns Dana Beach of the South Carolina Coastal Conservation League. Land trusts and other private organizations "promote a level of innovation and experimentation in private land conservation efforts that typically is not found in government controlled land conservation programs." Insofar as eminent domain can be used to force the development of previously undeveloped land, it poses a threat to the vitality of such conservation efforts, particularly those undertaken by nonprofits or politically unpopular organizations. The former are

increasing use of very broad definitions of blight that could encompass almost any property).

vulnerable to economic development takings because they do not produce tax revenue, and the latter because of their political weakness.

1. Private Land Conservation and Economic Development Takings

Economic development takings pose a particular threat to privately owned undeveloped lands. Such lands rarely generate significant tax revenue, nor are they sources of job growth. Large, undeveloped land parcels may also be particularly appealing to developers and local government officials, which makes conservation lands frequent targets of eminent domain. Palm Springs, California, for example, used eminent domain to take thirty acres of land bequeathed as a wildlife preserve in order to build a golf course. The city even sought to avoid paying for the land, but lost in court and was forced to pay $1.2 million. In New Jersey, Citgo Petroleum offered to give Petty's Island in the Delaware River to the state as a nature preserve. The site was once used by the company, but is now home to many animal species, including herons, egrets, and at least one pair of nesting bald eagles. The regional office of the United States Fish and Wildlife Service supported the move, but Pennsauken Township had other ideas. It sought to condemn the property and turn it over to residential development.

116. An important part of the appeal of larger, undeveloped parcels is that, other things being equal, the transaction costs of assembling a large lot for redevelopment will be lower the smaller the number of parcels that need to be acquired. Moreover, fewer parcels mean fewer landowners with whom developers must negotiate or against whom local governments must initiate eminent domain proceedings.

117. See, e.g., Johnston v. Sonoma County Agric. & Open Space Dist., 123 Cal. Rptr. 2d 226, 238–39 (Cal. Ct. App. 2002) (easement for wastewater pipeline across land protected by conservation easement was obtained involuntarily through threat of eminent domain); Christian Berthelsen, Group Battles Toll Road with Prayer, LOS ANGELES TIMES, May 21, 2006, at B3 (conservation easement threatened by proposed highway expansion); Carter Smith, Editorial, South Padre Island Faces Eminent Threat, SAN ANTONIO EXPRESS-NEWS, Dec. 31, 2005, at 11B (eminent domain sought against 1500-acre nature preserve); Debbie Swartz, 100 Residents Attend Hearing on Gas Pipeline, PRESS & SUN-BULL. (Binghamton, N.Y.), Apr. 5, 2006, at 1B (eminent domain proposed for construction of natural gas pipeline through nature preserve).

123. Stacie Babula, New Jersey Politics Flare in Scuffle Over Delaware River Island, BLOOMBERG NEWS SERVICE, July 28, 2005; Mixon, supra note 120.
Agricultural land is also threatened. In the wake of the *Kelo* decision, American Farmland Trust President Ralph Grossi warned, "[w]ith so much farmland on the urban edge and near cities still in steep decline, ex-urban towns could be tempted by this ruling to make farmland available for subdivisions." The American Farm Bureau Federation contends that the "sparsely developed lands of farmers and ranchers are particularly vulnerable" to the use of eminent domain for economic development purposes, such as increasing the local tax base. As the Federation explained in its amicus curiae brief in *Kelo*, "it will often be the case that more intense development by other private individuals or entities for other private purposes would yield greater tax revenue to local government."

Local governments frequently seek to use eminent domain to facilitate the industrial development of farmland. Bristol, Connecticut, for example, condemned a thirty-two-acre tree farm for the creation of an industrial park, an action Connecticut courts upheld as a "public use." In Kingston, Tennessee, Roane County officials sought to condemn seven farms covering 655 acres for an industrial park. Hartford, Connecticut, used eminent domain to take a mostly wooded parcel of land in an effort to keep a local manufacturing facility. In New York, the Onondaga County Industrial Development Authority sought to obtain 245 acres of farmland for residential, commercial, and industrial growth, including semiconductor fabrication plants, and was willing to use eminent domain if necessary to assemble the lots for development. In Greene County, Missouri, local officials sought to condemn a dairy farm in order to create a new industrial park. The condemnation was justified by the city...
manager as "protecting the tax base" and keeping "development closer into the city." The plan was later scrapped due to public opposition.

While agriculture can have significant environmental effects, farmland is important for the preservation of biodiversity and maintenance of open space. As areas once dominated by agriculture are developed, farmland is increasingly important for migratory species. Such land can serve as wildlife "corridors" that offer "opportunities for emigration to populate new patches of habitat." Farmland's contribution to biological diversity is different from that of truly undeveloped land. Nonetheless, "some agricultural areas with trees may protect as much biodiversity as neighboring forests and provide other benefits necessary for proper ecosystem functioning." Due to a range of government incentive programs and private conservation efforts, an increasing portion of agricultural land is explicitly devoted to conservation purposes.

Identifying the extent to which eminent domain has been used against forest land, farmland, or open space is difficult. There is no comprehensive data on the use, let alone threatened use, of eminent domain. According to one recent study, only a small fraction of government uses of eminent domain are reported. Nonetheless, eminent domain has regularly been

134. See Ralph E. Heimlich & William D. Anderson, Development at the Urban Fringe and Beyond: Impacts on Agriculture and Rural Land, in AGRIC. ECON. REP. 803, at 3 (U.S. Dep't of Agric., 2001) (noting that environmental impacts of agriculture are "generally less severe than those from urban development"); DAN IMHOFF, HABITAT AND FARMLANDS, http://www.biodiversitypartners.org/habconser/farm/03s.shtml ("massive-scale, industrial agriculture and development" has led to "significant losses" for flora and fauna). This is not meant to minimize the potential environmental impacts of agriculture, which are typically greatest with so-called "factory farms" and large-scale, intensive agricultural enterprises. See generally J.B. Ruhl, Farms, Their Environmental Harms, and Environmental Law, 27 ECOLOGY L.Q. 263 (2000).
136. Id.
139. See Dana Berliner, supra note 127, at 2 ("Many, if not most, private condemnations go entirely unreported in public sources . . . ."). Connecticut is the only state that keeps records of the use of eminent domain for redevelopment purposes. According to the Berliner study, fewer than six percent of the uses of eminent domain were reported in news sources searchable through LexisNexis. Id. at 8. Of course, it is possible that media coverage of proposed and actual condemnations will
used or threatened as a means to promote economic development at the expense of agricultural lands, conservation lands, and open space. More importantly, there are reasons to believe that the frequency of such takings will increase in the future as metropolitan areas and their suburbs expand into the surrounding countryside and local governments look for new ways to create jobs and increase their tax base.

The economic development rationale could be used to justify condemnation of almost any property. Property owned by nonprofit institutions is at special risk, however. Since nonprofit institutions do not pay property taxes, the condemning authority can always argue that tax revenue will increase if their property is transferred to a for-profit business. Moreover, many nonprofit institutions are likely to employ fewer people and generate less economic activity than do profit-making enterprises, further exacerbating their vulnerability. Economic development takings may also come at the expense of historic preservation if historic buildings are located in areas targeted for condemnation.

Environmental trusts are particularly disadvantaged. Since these organizations generally seek to keep their property in its pristine natural state, they are unlikely to use their land to employ significant numbers of people or engage in productive economic activity. Even prior to the Kelo decision—and the resulting media attention to the issue—land trusts identified eminent domain as a threat to private land conservation. In a December 2004 survey conducted by the Land Trust Alliance, eminent domain and condemnation were cited as reasons why land currently conserved by land trusts might not be protected in the future. As one park board member observed, “if you put a conservation easement on the land and you prevent development on the property, there’s nothing to increase as a result of the controversy generated by the Kelo decision. However, it seems unlikely that any such increase in media attention will be permanent, as both the public and reporters are likely to move on to other issues as time goes on.

WEEKLY, July 1, 2005, at 15 (eminent domain threatened against several historic businesses).
prevent a future county commission ... from reclaiming that property through eminent domain."\textsuperscript{145}

The risk to environmental conservation on private land is significant, particularly due to the extent of such conservation. Since the creation of the first land trusts over 100 years ago, environmental trusts have purchased land, easements, or other property interests to protect the land from development or overuse.\textsuperscript{146} As both the demand for environmental conservation and pressures for development on environmentally-sensitive lands have increased, so too has the use of environmental trusts.\textsuperscript{147} The number of land trusts in the United States rose from under sixty in 1950 to over 1200 in 2000.\textsuperscript{148} In 2004, the Land Trust Alliance reported that there were some 1500 local and regional land trusts around the country.\textsuperscript{149} This growth in land trust activity has been fueled by an increased demand for environmental conservation and legal developments that facilitate and encourage the purchase of conservation easements.\textsuperscript{150}

The 2003 Land Trust Census conducted by the Land Trust Alliance found that local and regional land trusts own some 1.4 million acres of land and conserved an additional five million acres through conservation easements and other voluntary agreements.\textsuperscript{151} From 1998 to 2003, the amount of land protected by conservation easements more than tripled.\textsuperscript{152} These figures exclude lands protected by national conservation organizations, such as Ducks Unlimited and The Nature Conservancy.\textsuperscript{153}

\textsuperscript{153} Parker, \textit{supra} note 111, at 487 n.22. Some estimates place the total amount of land protected by private conservation organizations at over 15 million acres nationwide. See MARY GRAHAM, \textit{THE MORNING AFTER EARTH DAY: PRACTICAL ENVIRONMENTAL POLITICS} 99 (1999) (citing estimates of
In some states, the amount of land protected is quite substantial. The Vermont Land Trust, for example, protects over seven percent of the land in the entire state of Vermont, mostly through conservation easements.\textsuperscript{154}

To fully measure the extent of private land conservation, and to identify all those lands potentially threatened by eminent domain, one would also have to account for the remaining privately owned, currently undeveloped land.\textsuperscript{155} For example, nearly sixty percent of America’s forests are privately owned,\textsuperscript{156} and much of this land is managed, at least in part, for conservation purposes.\textsuperscript{157}

Private land conservation is particularly important for wildlife conservation. A significant portion of wildlife habitat is owned by farmers and ranchers and is used for agricultural production.\textsuperscript{158} Over three-fourths of those species currently listed as threatened or endangered under the Endangered Species Act\textsuperscript{159} rely upon private land for some or all of their habitat.\textsuperscript{160} As John Turner, President of the Conservation Fund, observed, “[n]o strategy to preserve the nation’s overall biodiversity can hope to succeed without the willing participation of private landowners.”\textsuperscript{161}

The biodiversity so prevalent on private land is often located in areas under significant pressure for development. While popular discussions of biological diversity may focus on wilderness areas and habitats in far-flung locales, the greatest threats to biodiversity occur where habitat

\textsuperscript{13} and 4.7 million acres conserved by national and local organizations, respectively).

\textsuperscript{155} See McLaughlin, Role of Land Trusts, supra note 113, at 466 (“Although lacking the ‘flash and glamour’ associated with the protection of large parcels that have undeniable scenic or habitat value, the ordinary parcels protected by land trusts constitute a significant portion of the national landscape.”); see also John Randolph, Environmental Land Use Planning and Management 103 (2004) (“One of the most important categories of private land stewardship is those large blocks of roadless, natural land not currently in resource production. These are a de facto part of our nation’s conservation lands, but they are not permanently protected.”).

\textsuperscript{156} Constance Best & Laurie A. Wayburn, America’s Private Forests: Status and Stewardship 3 (2001).

\textsuperscript{157} Substantial amounts of private timber land are managed for conservation purposes during long cutting rotations. See, e.g., Terry L. Anderson & Donald R. Leal, Enviro-Capitalists: Doing Good While Doing Well 4–8 (1997) (describing efforts to improve wildlife habitat and recreation opportunities on land owned by International Paper).

\textsuperscript{159} 16 U.S.C. §§ 1531–1544.

disruption and modification is most prevalent. In fact, the number of endangered species tends to be greatest near human development and other activities.\textsuperscript{162} Approximately sixty percent of imperiled plants and animals\textsuperscript{163} are found in metropolitan areas, and thirty-one percent of those are found exclusively in such locations.\textsuperscript{164} Indeed, there is increasing recognition of the importance of biodiversity and ecological resources in and around urban areas.\textsuperscript{165}

As private land conservation continues to increase and metropolitan areas grow, the potential for conflict will increase. Much land targeted by land trusts and other conservation groups for protection is located near expanding metropolitan areas and sprawling suburbs. Nearly one-third of the land protected by local and regional land trusts lies in the densely populated Northeast.\textsuperscript{166} In many cases, the reason for obtaining a conservation easement is to prevent or limit anticipated development. These lands are likely to be among the first targeted by government officials seeking to create room for suburban expansion or development projects.

There are additional economic reasons why conservation land, farmland, and other open spaces may be particularly attractive to developers. This land will often be less expensive than other property, especially as compared to areas that are already developed. Property set aside for agricultural use may also be assessed at a lower value for tax purposes.\textsuperscript{167} Thus, taking such land for economic development purposes could provide a greater boost to local tax revenues than other available parcels.\textsuperscript{168}

Because many conservation areas, farms, and the like are located on larger land parcels, it will often be much easier to assemble large lots to

  \item \textsuperscript{168} If land is assessed at a lower value for a given use, such as agriculture, transferring that land to another use with a higher tax assessment can increase tax revenue.
\end{itemize}
\end{footnotesize}
facilitate larger development projects on such land. 169 The economic and political costs of condemning a few farms will often be less than those of seeking to relocate scores of homeowners from an inner-ring suburb. Indeed, this is one of the reasons that some states have enacted statutes imposing specific limits on the use of eminent domain against farmland. 170 The federal government also places additional administrative hurdles on the taking of parks through eminent domain out of the recognition that there are substantial incentives to use such land for many types of development. 171 As the Supreme Court observed in Citizens of Overton Park v. Volpe, governments seeking to assemble large parcels will often prefer parkland to available alternatives. 172 Among other things, "since people do not live or work in parks, if a highway is built on parkland no one will have to leave his home or give up his business." 173 The same can be said of much privately owned, undeveloped land.

Conservation easements, when acting alone, do not protect lands from eminent domain; they can be extinguished by the use of eminent domain. 174 In some jurisdictions, however, there are explicit limitations on the use of eminent domain to take farmland or other properties covered by conservation easements. 175 Where such statutory protections do not exist, the existence of a conservation easement may actually make some properties more vulnerable to economic development takings 176 by lowering the assessed value of a land parcel, reducing the local tax base, and making the parcel less expensive to acquire. 177 At the same time, the

169. See supra note 116.
173. Id. at 412.
175. See Much Ado About Kelo, supra note 170, at 2 (noting twelve states have laws limiting the use of eminent domain against farmlands enrolled in agricultural districts).

holder of the conservation easement is likely to place a high subjective value on keeping land in an undeveloped state. This suggests that the owners of conservation lands may be less willing to negotiate the sale of development rights, and more likely to be the sort of “holdouts” often used to justify the use of eminent domain in the first place. This also suggests that the owners of conservation easements are likely to feel undercompensated when their property is taken, as it is likely that they place a higher subjective value on the land than the average owner of an equivalent plot of land.

Even if one concludes that the condemnation of conservation lands for economic development has been relatively rare to date, there are reasons to expect that the rate of such takings will increase in the future. Defenders of eminent domain acknowledge that conservation easements “are already under challenge in many places, and the social and legal pressure to remove or modify easement restrictions will only increase as decades and centuries pass.” In some communities with substantial amounts of conservation activity, opposition to easements appears to be increasing. Some communities dependent on resource extraction are also hostile to land trust activity.

The proliferation of land trusts and conservation easements is a relatively recent phenomenon. While the first private land trust was established in 1891, state statutes authorizing conservation easements did not become common until almost a century later. Moreover, a large percentage of the land protected by conservation easements is located in or near densely populated areas where there is significant urban expansion. This is no coincidence, as the threat of approaching development often provides the impetus for the creation of a conservation easement, if not the outright purchase of land by a local trust. As suburban boundaries expand,

178. John D. Echeverria, Revive the Legacy of Land Use Controls, OPEN SPACE, Summer 2004, at 12. To Echeverria, the potential threat to the permanence of conservation easements is a reason to rely more on government regulation. The authors, on the other hand, would prefer to reduce the threat by limiting the use of eminent domain.

182. The National Conference of Commissioners on Uniform State Laws did not draft the Uniform Conservation Easement Act (UCEA) until 1981. Pugh, supra note 174, at 10,559; see also id. at 10,558 (noting conservation easements have become popular since the 1980s).
the pressure to develop the surrounding countryside will only increase.\textsuperscript{183} Thus, in those states in which economic development takings are permitted, conservation lands and open space will be under relatively greater threat.

2. Lessons from the Experiences of Religious Institutions

The vulnerability of property owned by nonprofits to economic development takings is best documented in cases involving religious institutions such as churches. Sixteen churches were destroyed as a result of the notorious 1981 Poletown condemnations, which leveled a Detroit neighborhood for the purpose of building a new General Motors factory.\textsuperscript{184} More recent examples of economic development takings targeting religious property include the attempted condemnation of a church in order to build a Costco in Cypress, California;\textsuperscript{185} condemnation of an Illinois mosque for the purpose of building private rental housing;\textsuperscript{186} and the taking of an Indiana church for "redevelopment" by new private owners.\textsuperscript{187} Even in the aftermath of \textit{Kelo}, which has focused public attention on eminent domain abuse, authorities in a small city near Tulsa are proceeding with plans to condemn a small Baptist church in order to "make way for superstores like . . . Home Depot."\textsuperscript{188} Similarly, the Hawaii Supreme Court recently upheld the condemnation of church property in Honolulu for the purpose of benefitting private condominium owners.\textsuperscript{189}

The Becket Fund for Religious Liberty, a public interest law firm, has compiled a list of numerous other recent cases where economic development condemnations have been used or threatened against religious institutions.\textsuperscript{190} As the Becket Fund amicus brief in \textit{Kelo} argues:

\textbf{187.} \textit{City Chapel Evangelical Free Inc. v. City of South Bend, 744 N.E.2d 443 (Ind. 2001).}

\textbf{189.} \textit{City and County of Honolulu v. Sherman, 129 P.3d 542 (Haw. 2006).}

\textbf{190.} Brief for Becket Fund for Religious Liberty as Amicus Curiae Supporting Petitioners, \textit{Kelo v. City of New London, 125 S. Ct. 2655} (2005) (No. 04–108), 2004 WL 2787141. The list of cases cited here and in the Becket Fund brief probably understates the true extent of the phenomenon because it is based upon published decisions and press reports. Many condemnation actions do not result in a published decision and/or are not covered by the press.
Because religious institutions are overwhelmingly non-profit and tax-exempt, they will generate less in tax revenues than virtually any proposed commercial or residential use. Accordingly, when a municipality considers what properties should be included under condemnation plans designed to increase for-profit development and increase taxable properties, the non-profit, tax-exempt property of religious institutions will by definition always qualify and always be vulnerable to seizure:

The Becket Fund's point applies with equal, if not greater, force to environmental nonprofits. They also generate less tax revenue than almost any "commercial or residential use" properties and will "always be vulnerable to seizure" on economic development grounds. In many, if not most, instances, local and regional land trusts will lack the political power that sometimes protects churches with large congregations against the threat of eminent domain. Whereas churches and other religious institutions often have local congregations to protect their interests, land trusts often lack an equivalent base of popular support. This may be particularly true in the case of larger land trusts that lack local memberships, some of which may be viewed as "absentee landlords" by local residents. Many lands protected today, such as Hawk Mountain in Pennsylvania, would not have been preserved if they were dependent upon local political support.

3. The Possibility of Circumvention

One possible objection to our argument is that in most instances where eminent domain is used to take undeveloped land, the condemnation would be able to proceed under our proposed rule because it would satisfy the requirements outlined by the Michigan Supreme Court in *Hathcock*.

191. Id. at 11.
192. Id. at 11 (emphasis omitted).
193. Some argue that churches are often able to protect themselves through the political process. See Nicole Stelle Garnett, *The Neglected Political Economy of Eminent Domain*, 105 MICH. L. REV. 101, 115-19. However, this is likely to be true only of churches with substantial influence over local politics. Cf. id. at 115-17 (describing how the wealthy and locally powerful Catholic Church was able to prevent some of its churches from being condemned in Chicago at a time when Catholics were a majority of Chicago voters and "both majoritarian and minoritarian forces favored church preservation"). Religious institutions affiliated with poor or politically weak denominations are unlikely to be equally successful.
A ban on economic development takings can often be circumvented through expansive interpretations of blight or other legal maneuvers. For example, when California City took several thousand acres of land in the Mojave Desert for the construction of a Hyundai facility and test track, it did so by designating the property as blighted, even though it is difficult to explain why an ecologically valuable desert should be considered blighted. The project, labeled a "poster child" for eminent domain abuse by California’s Attorney General, harmed local desert tortoise and Mojave ground squirrel populations. Similarly, a proposed landfill that threatened the taking of portions of Duke Forest would likely have qualified as a "public use," even though it threatened a precious natural resource. In jurisdictions that prohibit pure economic development takings, there is pressure to generate blight designations that will pave the way for other uses of eminent domain.

To be sure, a prohibition on economic development takings will not bar all environmentally harmful uses of eminent domain. Environmentally harmful takings which transfer land to government ownership would not be prohibited. In addition, a ban on economic development takings is unlikely to be fully effective unless it is coupled with restrictions on the definition of blight which prevent blight designations from being applied to virtually any property. However, a ban on economic development takings is almost certainly a necessary prerequisite to any judicial or legislative effort to limit the definition of blight. Property owners will have little incentive to challenge expansive definitions of blight, and

196. See infra notes 197–200 and accompanying text.
198. McClure, supra note 197, at W.
200. One of the most notorious recent examples of this sort of "blight abuse" occurred in Lakewood, Ohio. In preparation to use eminent domain to clear a neighborhood for an upscale mixed-use development, local officials commissioned a blight study relying upon blight criteria broad enough to encompass approximately ninety percent of all the homes in the city (including the home of the then-mayor). See Samuel R. Staley & John P. Blair, Eminent Domain, Private Property, and Redevelopment: An Economic Development Analysis, POL’Y STUDY 331 (Reason Public Policy Institute, Los Angeles, Calif.), Feb. 2005, available at http://www.reason.org/ps331.pdf.
201. See supra Part I.B.1 (explaining that a ban on economic development takings would not prohibit condemnations that transfer property to public ownership).
judges little reason to strike them down, if the condemnation in question could just as easily be defended using an economic development rationale.

Even without additional reforms, a ban on economic development takings will prevent at least some exercises of eminent domain that are likely to have negative environmental effects. Not all states have expansive definitions of blight, and a ban on the economic development rationale will have a larger impact in states with narrower blight statutes. Furthermore, requiring developers and local governments to obtain a blight designation before condemning environmentally valuable land might increase the transaction costs of condemnation and thereby deter some uses of eminent domain. It is also possible that some erroneous blight designations could be challenged successfully in court. Finally, although the issue has not yet been litigated, it is possible that some of the more extreme definitions of blight—such as those that define it as essentially coextensive with supposedly insufficient economic development—could be struck down as inconsistent with state constitutional bans on economic development takings. Without any comprehensive data on the use, and threatened use, of eminent domain, it is impossible to determine exactly how much protection a ban on economic development takings would provide. It is clear, however, that such a ban would provide greater protection for environmental values than what exists in its absence.

4. Eminent Domain and Urban Sprawl

Some environmental analysts and urban planners claim that eminent domain is a powerful tool which can be used to protect conservation lands

203. See Luce, supra note 71 (surveying legal definitions of blight in every state).
204. Several states have narrowed their definitions of blight in the aftermath of Kelo. See Somin, Limits of Backlash, supra note 3, at 21–24.
205. For a more detailed discussion of such procedural constraints on eminent domain and their limitations, see Somin, Controlling, supra note 3, at 37–40. For arguments that procedural protections can have a major impact in limiting eminent domain abuse, see, e.g., Merrill, supra note 89, at 18; David J. Barron & Gerald E. Frug, Make Eminent Domain Fair for All, BOSTON GLOBE, Aug. 12, 2005, at A14.
206. See, e.g., Sweetwater Valley Civic Ass’n v. Nat’l City, 555 P.2d 1099, 1103 (Cal. 1976) (holding that property could not be taken under California’s blight condemnation law merely because “the area is not being put to its optimum use, or that the land is more valuable for other uses”).
207. See, e.g., Las Vegas Downtown Redev. Agency v. Pappas, 76 P.3d 1, 13 ( Nev. 2003) (“Economic blight involves downward trends in the business community, relocation of existing businesses outside of the community, business failures, and loss of sales or visitor volumes.”). Obviously, virtually all communities occasionally experience “downward trends in the business community” and “business failures.” Id. at 13.
and combat urban sprawl.\textsuperscript{208} Jeff Finkle of the International Economic Development Council, for example, warns that if cities cannot use eminent domain for redevelopment, "the only land that will be developed is green space on the edge of cities."\textsuperscript{209} The fear is that if the transactions costs of assembling large lots for development are too high in urbanized areas, developers will focus their efforts on rural lands.\textsuperscript{210}

There is some irony in the argument that eminent domain is a defense against sprawl, as historically eminent domain has been used to promote sprawl far more than to control it.\textsuperscript{211} Many of the highways and transportation projects that have facilitated the geographic expansion of metropolitan areas and their suburbs were facilitated by condemnation.\textsuperscript{212} Today eminent domain is more often used to limit suburban development, but most of those takings do not rely upon the economic development rationale.\textsuperscript{213} As noted above, the limitations we propose do not prevent the use of eminent domain to preserve open space or address environmental contamination.\textsuperscript{214} Therefore, the only remaining environmental objection is that barring economic development takings would prevent the use of eminent domain for projects that would discourage sprawl by redeveloping and densifying urban areas, and that such projects can be expected to yield net environmental benefits in excess of the expected environmental costs of economic development takings. Yet for the reasons discussed earlier, it

\begin{itemize}
\item \textsuperscript{208} See supra note 89 and sources cited therein.
\item \textsuperscript{209} See supra note 200, at 8.
\item \textsuperscript{210} See supra note 200, at 8 ("It is much easier to acquire large tracts of land by buying up green fields at the outer fringes of urban areas.").
\item \textsuperscript{211} See, e.g., Nicole Stelle Garnett, \textit{The Public-Use Question as a Takings Problem}, 71 Geo. Wash. L. Rev. 934, 952 (2003) (noting the construction of the interstate highway system was "characterized by a massive exercise of the power of eminent domain that resulted in overconsumption of private land"); Terry J. Tondro, \textit{Sprawl and Its Enemies: An Introductory Discussion of Two Cities' Efforts to Control Sprawl}, 34 Conn. L. Rev. 511, 514 (2002) (noting the construction of highway networks is one of the "usual suspects" blamed for sprawl because highways "open up wide areas of open space to development").
\item \textsuperscript{212} As noted supra Part I, limiting the use of eminent domain for economic development does not prevent the use of eminent domain for the creation of parks, the preservation of open space, or the adoption of zoning or other land-use controls.
\item \textsuperscript{213} See supra Part I.
\end{itemize}
is questionable that even the most well-intended projects will produce such results. 215

One potential use of eminent domain, which could limit urban sprawl, would be to utilize it to promote denser redevelopment. Denser urban development can produce significant environmental benefits by reducing the footprint of human development on the countryside, among other things. However, increased density can also produce environmental costs, particularly if it results in more intensive land use or the loss of open space. Replacing a low-density residential community along the Atlantic Coast with a high-density commercial development, as has been proposed in Florida's Riviera Beach, for example, is likely to have a significant impact on the coastal environment. 216 Recent research shows that open space within urban areas provides substantial public benefits, as reflected in local property values. 217 Using eminent domain to increase density at the expense of such open space would not benefit many communities.

Theoretically, increased population density in urban settings should reduce traffic congestion and air pollution. 218 In practice, however, the exact opposite appears to occur. As population density increases, so too do vehicle miles traveled and urban traffic congestion. 219 As a result, those areas with the highest population densities have the worst urban air pollution. 220 One reason for this is that increasing population density

215. See supra Part I.
219. See Randall G. Holcombe, The New Urbanism Versus the Market Process, 17 REV. OF AUSTRIAN ECON. 285, 290 (2004) ("If traffic congestion is a problem, increasing population density will add more traffic to already congested areas, making the problem worse."); see also Wendell Cox, Coping with Traffic Congestion, in A GUIDE TO SMART GROWTH: SHATTERING MYTHS, PROVIDING SOLUTIONS 41-42 (Jane S. Shaw & Ronald D. Utt eds., 2000) ("As urban density increases, so do vehicle miles traveled per square mile.").
220. See Kenneth Green, Air Quality, Density, and Environmental Degradation, in SMARTER GROWTH: MARKET-BASED STRATEGIES FOR LAND-USE PLANNING IN THE 21ST CENTURY 79 (Randall G. Holcombe & Samuel R. Staley eds., 2001) (citing data suggesting a correlation with density and ambient air pollution); Holcombe, supra note 219, at 287-88 ("If the higher the population density, the worse the environmental degradation in almost every dimension."); id. at 288 ("Pollution is the highest where population density is the highest."); Randal O'Toole, ISTEA: A Poisonous Brew for American Cities, CATO INSTITUTE POLICY ANALYSIS No. 287, Nov. 5, 1997, at 24 ("[T]he major U.S. cities and metropolitan areas, smog problems are strongly correlated with population density. . . . Cleaner air correlates with lower densities."); see also Heimlich & Anderson, supra note 134 (noting
increases the number of vehicles on the road, even where mass transit is available.\textsuperscript{221} In addition, most vehicle emissions are higher when vehicles are traveling at lower speeds, as they are likely to do in urban traffic jams.\textsuperscript{222} The point here is not to argue that dense redevelopment of city cores and inner-ring suburbs is, on the whole, environmentally harmful. Rather, the point is that dense urban redevelopment is not an unalloyed environmental good.\textsuperscript{223}

Even if one assumes that most urban economic development projects that rely upon eminent domain will produce net environmental benefits, this does not mean that a legal rule allowing for economic development takings will likewise prove environmentally beneficial. If governments can use eminent domain for economic development purposes, then it can be used for both good and ill. If cities and inner-ring suburbs are allowed to use eminent domain to facilitate denser development, outlying communities can use it to pave the way for greater suburban growth. The same power which enables a city to redevelop an urban core enables a suburb to replace open space with an industrial park or a strip mall. In this way, eminent domain can be used to promote suburban sprawl and metropolitan deconcentration, with all of its attendant social costs.\textsuperscript{224} In assessing the aggregate environmental impacts of economic development takings, one must consider both the positive and negative uses of that power. Barring the adoption of specific limits on the use of eminent domain in particular areas, the permissive approach embodied in the \textit{Kelo} decision is likely to lead to greater environmental harm than the \textit{Hathcock} alternative.

\textbf{B. Other Environmental Harms of Economic Development Takings}

Economic development takings can contribute to environmental degradation in less direct ways as well. Most clearly, they can be used to

\begin{itemize}
\item air quality improvements from "decentralizing population and employment").
\item \textsuperscript{221} \textit{See Cox, supra} note 219, at 41--42.
\item \textsuperscript{222} \textit{See Cox, supra} note 219, at 45. This is true for emissions of carbon monoxide and volatile organic compounds at speeds lower than fifty-five miles per hour. Nitrogen oxide emissions, on the other hand, increase once average vehicle speeds rise above twenty miles per hour. \textit{Id.} at 44.
\item \textsuperscript{223} It is also worth noting that the per capita cost of providing many public services may actually \textit{increase} with population density. \textit{See Helen F. Ladd, Population Growth, Density and the Costs of Providing Public Services, 29 Urb. Stud.} 273, 292--93 (1992).
\item \textsuperscript{224} \textit{See generally Joseph Persky \& Wim Wiewel, When Corporations Leave Town: The Costs and Benefits of Metropolitan Job Sprawl} (2000). Of course, some would argue that the environmental and social costs of sprawl are exaggerated. \textit{See, e.g., A Guide to Smart Growth: Shattering Myths, Providing Solutions, supra} note 219; \textit{William T. Bogart, Don't Call It Sprawl} (forthcoming); \textit{Robert Bruegmann, Sprawl: A History} (2005). \end{itemize}
facilitate unsustainable economic development and the establishment of pollution-generating enterprises. Economic development takings operate as a subsidy for economic development generally, and often for politically powerful interest groups in particular. Such takings represent a subsidy to development because, other things being equal, the use of eminent domain reduces the costs of proceeding with a given development project for developers. Absent the use of eminent domain, developers would have to pay a higher price to obtain desired properties, if they are able to acquire such properties at all. If development is subsidized in this fashion, there will be more of it—and more of the resulting environmental effects, ranging from air pollution and congestion to habitat loss and non-point source water pollution.225

There is also a danger that economic development condemnations might damage environmental quality by undermining property rights, squandering public resources, and reducing communal wealth. Economic development takings often lead to the establishment of enterprises that could not have survived in a competitive market because they generate less economic value than did preexisting land uses.226 Since wealth and income are among the strongest correlates of efforts to promote environmental quality, economic development takings paradoxically undermine environmental quality by dissipating wealth and reducing economic growth.

1. Interest Group Capture of the Eminent Domain Process

When eminent domain is used for economic development, it is rarely public-spirited redevelopment solely overseen by disinterested urban planners and “smart growth” advocates. The eminent domain process is highly vulnerable to “capture” by narrow interest groups.227 Particularly in urban centers, redevelopment plans are the product of competing political and economic pressures, including the desires of powerful interest groups

226. As already noted, eminent domain operates as a subsidy for economic development. This means that the use of eminent domain will allow some projects to proceed that, otherwise, would not have. Perhaps the paradigmatic example of economic development projects that fail to generate net economic benefits are athletic arenas. See generally ROGER NOLL & ANDREW ZIMBALIST, SPORTS, JOBS, AND TAXES: THE ECONOMIC IMPACT OF SPORTS TEAMS AND STADIUMS (1997) (summarizing research demonstrating public subsidies for sports do not generate net economic benefits).

227. See Somin, Controlling, supra note 3, at 8–23; Somin, Overcoming Poletown, supra note 7, at 1010–24.
and the need to enhance local tax revenue. For a variety of reasons, the adoption of economic development takings is far more likely to be driven by the political power of beneficiaries than by the prospect of environmental or other public benefits. Indeed, the bigger the project, the more likely it is to be affected by special-interest power. The inevitable political compromises limit the likelihood that redevelopment plans will meet some theoretical environmental ideal. In some instances, redevelopment plans are driven by the developers who will profit from the project, and public needs are, at best, an afterthought.

2. The Costs of Economic Development Takings are Likely to Exceed the Benefits

Economic development projects rarely produce the economic gains, or any other gains for that matter, that their proponents allege. Therefore, it is unlikely that economic development takings will generate sufficient economic benefits to offset their environmental costs. The notorious Poletown condemnations, for example, may actually have destroyed more jobs than the development project created in its place. The new GM factory built as a result of the condemnations created less than half the promised 6150 jobs, while the destruction of 150 to 600 businesses and numerous nonprofit organizations may well have led to the loss of an equal or greater number of positions. When one factors in the $250 million in public funds expended on the project, and the economic cost of destroying numerous homes, churches, businesses, and schools, it is highly likely that the economic costs of the Poletown condemnations greatly outweighed any benefits. The same is true of the Kelo condemnations, where some $80 billion in public funding has already been expended, with little, if any, prospect of commensurate gains.

228. For a detailed discussion of the reasons, see Somin, Controlling, supra note 3, at 8–23; Somin, Overcoming Poletown, supra note 7, at 1010–24.

229. See Somin, Controlling, supra note 3, at 8–23; Somin, Overcoming Poletown, supra note 7, at 1010–24.

231. Somin, Overcoming Poletown, supra note 7, at 1017–18.

232. Id.

These results are not accidental. There are several systematic reasons why economic development takings are likely to generate costs that exceed their benefits. First, none of the states that permit economic development takings require the new owners of condemned property to actually produce the economic benefits that were used to justify condemnation in the first place. This, combined with the refusal of courts in these states to consider the economic costs imposed by condemnation projects in their decisions, gives local governments and developers strong incentives to oversell condemnation projects by using inflated estimates of their benefits. In other cases, local officials promise that projects will spur economic development without identifying what is to be developed.

Second, the more economic development projects are subsidized through the use of eminent domain, the more likely it is that inefficient projects will proceed. As former Milwaukee mayor and president of the Congress for New Urbanism John Norquist argued in his *Kelo* amicus brief, "speculative over-use of eminent domain may actually have a chilling effect on the rigorous economic screening of projects naturally occurring in the private marketplace, and may result in an increased number of unsustainable development projects." If large eminent domain projects fail to produce the job growth or tax revenues promised by their proponents, why should one expect them to generate promised environmental benefits?

Further, the costs and benefits of economic development takings are extremely difficult for voters to determine; which ensures that officials who approve inefficient development projects will rarely, if ever, be punished at the ballot box. Even in cases where it is possible for voters

235. See *Kelo*, 843 A.2d at 541 n.58 (refusing to consider costs imposed by condemnation because "the balancing of the benefits and social costs of a particular project is uniquely a legislative function"); Somin, *Controlling*, supra note 3, at 15-17 (describing failure to consider costs).

236. See, e.g., Krauter v. Lower Big Blue Nat. Res. Dist., 259 N.W.2d 472, 475-76 (Neb. 1977) (striking down condemnation because there was no clear plan as to how the condemned property would be used).

237. Brief for John Norquist, President, Congress for New Urbanism, as Amicus Curiae Supporting Petitioners, at 3, *Kelo* v. City of New London, 125 S. Ct. 2655 (2005) (No. 04-108), available at http://www.ij.org/pdf_folderprivate_property/kelo-norquist08.pdf; see also Gelinas, supra note 230 ("In the free market, a poorly designed project will fail and be replaced by a well-designed project—or just won't find private financing to get built. With government central planning, ill-designed projects last forever—and they retard natural growth around them.").

to determine the costs and benefits accurately, any such accounting is unlikely to be feasible until years after the fact, by which time many of the officials who approved the condemnation are likely to be out of office.\(^239\) In any event, by that point public attention will have moved on to other issues.

Finally, the need to prevent "holdouts"—the standard rationale for economic development takings—can in most cases be addressed without resort to eminent domain. If a private development project really will use the property for purposes more valuable than those to which it is currently devoted, the developers can prevent holdouts from blocking the project by using secret purchases or precommitment strategies.\(^240\) Of course, where conservation groups, or others, place a high subjective value on maintaining given lands in an undeveloped state, they should not be considered holdouts. Such landowners are not engaged in strategic behavior in order to maximize their compensation, but are rather "sincere dissenters" from the merits of the development project who genuinely value the current uses of the land more than the developer values his or her own projected uses.\(^241\)

3. Endangering the Environmental Benefits of Property Rights

Eminent domain is generally viewed as a threat to property rights, as evidenced by the strong negative reaction to the \textit{Kelo} decision by various groups representing property owners. The rule ratified in \textit{Kelo} is, regardless of its other merits, less protective of property rights than that urged by the \textit{Kelo} dissenters and also adopted by the Michigan Supreme Court in \textit{Hathcock}. This, too, could have negative environmental consequences insofar as it undermines the security of property rights on the margin. Individuals are less likely to make investments in the long-term conservation of environmental resources on private land when they are uncertain if their investments will bear fruit.\(^242\)

International studies of economic and environmental trends demonstrate that "environmental quality and economic growth rates are greater in regimes where property rights are well defined than in regimes

\(^{239}\) \textit{Id.}.

\(^{240}\) For detailed explanations of the reasons why this is true, see Kelly, \textit{supra} note 91; Somin, \textit{Controlling}, \textit{supra} note 3, at 21–28.

\(^{241}\) See Somin, \textit{Controlling}, \textit{supra} note 3, at 23 (distinguishing strategic holdouts and sincere dissenters).

\(^{242}\) See Staley & Blair, \textit{supra} note 200, at 2.
where property rights are poorly defined." 243 The security of property rights encourages owners to pursue the enhancement of their own subjective value preferences, including both commercial and non-commercial values. 244 Property rights enable forest landowners to protect their investment in planting trees or otherwise enhancing forest growth; 245 investments made by conservation groups in ecological protection and restoration are also protected. 246 Conversely, a lack of property rights provides substantial incentives to deplete valuable resources. 247 Where property rights are not secure, owners are less likely to invest in improving or protecting a resource, and are more likely to consume it as quickly as possible in a "tragedy of the commons" scenario. 248 On the margin, the more purposes for which government authorities may exercise eminent domain, the less secure private property rights will be.

4. Endangering the Environment by Reducing Societal Wealth

The history of condemnation for economic development raises further concerns. As discussed above, economic development takings are more likely to retard economic growth than enhance it. 249 Condemnations can

244. See Louis De Alessi, Gains from Private Property: The Empirical Evidence, in PROPERTY RIGHTS: COOPERATION, CONFLICT, AND LAW 90, 108 (Terry L. Anderson & Fred S. McChesney eds., 2003); see also Harold Demsetz, Toward a Theory of Property Rights, 57 AM. ECON. REV. 347, 356 (1967) ("The development of private rights permits the owner to economize on the use of those resources from which he has the right to exclude others."); Robert J. Smith, Resolving the Tragedy of the Commons by Creating Private Property Rights in Wildlife, 1 CATO J. 439, 456 (1981) ("Wherever we have exclusive private ownership, whether it is organized around a profit-seeking or nonprofit undertaking, there are incentives for the private owners to preserve the resource.").

246. See Smith, supra note 244, at 456 (private ownership protects both for-profit and nonprofit undertakings).

247. As Anthony Scott observes, "[n]o one will take the trouble to husband and maintain a resource unless he has a reasonable certainty of receiving some portion of the product of his management; that is, unless he has some property right in the yield." Anthony Scott, The Fishery: The Objectives of Sole Ownership, 63 J. POL. ECON. 116, 116 (1955). While it may be an overstatement to claim that "no one" will act in such a manner, the marginal effect should be indisputable. Id.

248. For the classic analysis, see Garrett Hardin, The Tragedy of the Commons, SCIENCE, Dec. 13, 1968, at 1243.

249. See supra Part II.B.2 (explaining why the economic costs of development takings are likely
increase the amount of development—for instance by creating an industrial park or facilitating a given redevelopment project—but this is not the same thing as increasing economic growth and societal wealth. In some cases, economic development condemnations may provide the worst of both worlds by increasing the amount of environmentally harmful development while simultaneously retarding overall economic growth.

Economic development takings are unlikely to provide economic benefits sufficient to offset the costs, environmental and otherwise. Insofar as this is the case, using eminent domain for economic development squanders scarce resources and retards the accumulation of societal wealth. This, too, can have negative environmental effects of its own. Wealthier societies have both the means and the desire to address a wider array of environmental concerns. Economic growth fuels technological advances and generates the resources necessary to deploy new methods for meeting human needs efficiently and effectively. Public support for environmental measures, both public and private, is correlated with changes in personal income. This is evidenced by the fact that donors to environmental groups tend to have above-average incomes. Empirical to exceed the benefits); see also Gelinas, supra note 230 (discussing New Haven, Connecticut, as an example of where redevelopment projects likely did more harm than good); Thomas Garrett & Paul Rothstein, The Taking of Prosperity: Kelo v. New London and the Economics of Eminent Domain, REGIONAL ECONOMIST, Jan. 2007, at 4 (summarizing reasons why economic development takings are likely to diminish prosperity rather than increase it).

251. See, e.g., Aaron Wildavsky, SEARCHING FOR SAFETY (1988) (providing extensive arguments and evidence showing that increasing societal wealth produces environmental and safety benefits).

253. Stroup & Meiners, supra note 252, at 15 (discussing 1992 reader survey for Sierra magazine
evidence also suggests that wealthier communities are more likely to support governmental efforts to preserve open space through the use of bond issues and other local measures.\textsuperscript{254} While the marginal effects of this phenomenon may be small in any given case, the loss of societal wealth is yet another negative environmental consequence that must be added to the ledger when assessing the environmental impact of using eminent domain for economic development.

CONCLUSION

From an environmental perspective, eminent domain is a two-edged sword. It can be used to provide environmental public goods and preserve undeveloped land. At the same time, however, it can also be used to condemn farms, extinguish conservation easements, subsidize unsound development, and pave the way for suburban expansion into the countryside. Whatever the overall impact of eminent domain on the environment, it is clear that its use for economic development has considerable environmental costs and few, if any, environmental benefits. The economic development rationale is not needed to justify the use of eminent domain for environmental protection. On the other hand, it can be, and has been, used to justify condemnations that inflict environmental harms. For this reason, the rule embodied by Kelo will result in environmental harm.

As this Article goes to press, legislatures and local communities around the country are considering efforts to reform or limit the use of eminent domain.\textsuperscript{255} Some thirty-five states have already adopted post-Kelo reform laws.\textsuperscript{256} Litigation over the constitutionality of economic development takings also continues in state courts.\textsuperscript{257} These efforts are largely motivated by concerns about the equity and efficiency of eminent domain.

finding that members of the Sierra Club have an average household income more than double the U.S. average).

\textsuperscript{255} For a detailed list of post-Kelo reforms adopted so far, see Castle Coalition, Enacted Legislation, http://www.castlecoalition.org/legislation/passed/index.html (last visited Feb. 11, 2007); see also Somini, Limits of Backlash, supra note 3, at 10–11.

\textsuperscript{256} Somini, Limits of Backlash, supra note 3 (discussing reform in thirty-five states); CASTLE COALITION, LEGISLATIVE ACTION SINCE Kelo 1 (2007), http://www.castlecoalition.org/pdf/publications/State-Summary-Publication.pdf (listing thirty-four states, but not counting reform enacted in Nevada). Unfortunately, most of the laws adopted so far are likely to be ineffective. See Sandefur, supra note 3; Somini, Limits of Backlash, supra note 3, at 11–22.

\textsuperscript{257} See, e.g., Bd. of County Comm’rs of Muskogee County v. Lowery, 136 P.3d 639, 642 (Okla. 2006) (post-Kelo decision banning economic development takings under state constitutional law).
But the potential environmental consequences of eminent domain should also be considered in these efforts. Prohibiting economic development takings, as some states have already done, will not hamper ongoing efforts to conserve environmental values. Similarly, states should adopt measures to guard against the opportunistic use of blight designations and other methods of circumventing the limits on eminent domain abuse; a prohibition on economic development takings can only protect undeveloped lands from eminent domain if it is diligently enforced.

During the debate over *Kelo*, few environmental advocates voiced concerns about the threat posed by economic development takings, and some even claimed that the decision would advance the cause of environmental protection. This is regrettable. Economic development takings pose a significant threat to environmental quality, while providing few if any environmental benefits.
